

Appendix 3: Additional models results

1. Models with traits

Specification of the models: We used `lme4` package to perform a GLMM with binomial (proportion) distribution. An example of the code for each dataset are as follows:

```
mhigh.spe <- glmer(cbind(occor, n.visit-occor) ~  
  forest_site400*lbody_size +  
  forest_site400*nest +  
  forest_site400*diet +  
  forest_site400*lower_stratum +  
  forest_land*lbody_size +  
  forest_land*nest +  
  forest_land*diet +  
  forest_land*lower_stratum +  
  (forest_site400 + forest_land|sp) +  
  (1|landscape:sp) + (1|site:sp) +  
  (lbody_size + nest + diet + lower_stratum|landscape) +  
  (lbody_size + nest + diet + lower_stratum|site),  
  family=binomial, data=high.spe,  
  nAGQ = 1, control = glmerControl(optimizer = "bobyqa",  
    optCtrl = list(maxfun = 500000)))
```

We ran separate models for each assemblage and trait. Afterwards, we ran one model with the combination of the traits body mass, diet, nest type and % of lower strata use. Table S3.1 shows the marginal R^2 of all models terms.

2. Models coefficients

Tables S3.2, S3.3, S3.4, and S3.5 show the coefficients for each model.

3. Models diagnostic

Variance Inflation Factor of the model parameters for each dataset in Table S3.6.

Table S3.1: Overall and marginal R-squared of trait models in each dataset. For the marginal R-squared terms see Table 2 (main text).

forest.landscape	NA	1.16	1.20	1.20
diet_nectarivorous	NA	NA	2.46	2.46

Example of the residual diagnostic of the model with the combined traits (main diet, body mass, nest type and % of lower strata use) for the forest specialists in high-quality matrix landscapes. The models' diagnostics for the other assemblages were all similar and can be checked in this Rmd file.

Residual correlations among species and sites

Below we present the Kendall correlations for the residuals among species and sites for the models using the predictions for **site:sp** random effect (Observation Level Random Effect). For the residual correlations we followed the code provided by Miller, Damschen & Ives (2018).

Range of species correlations: -0.4, 0.43. Range of sites correlations: -0.3, 0.27.

Figure S3.1: Species residual Kendall correlations for the specialist species in high-quality matrix landscapes.

Figure S3.2: Sites residual Kendall correlations for the specialist species in high-quality matrixlandscapes.

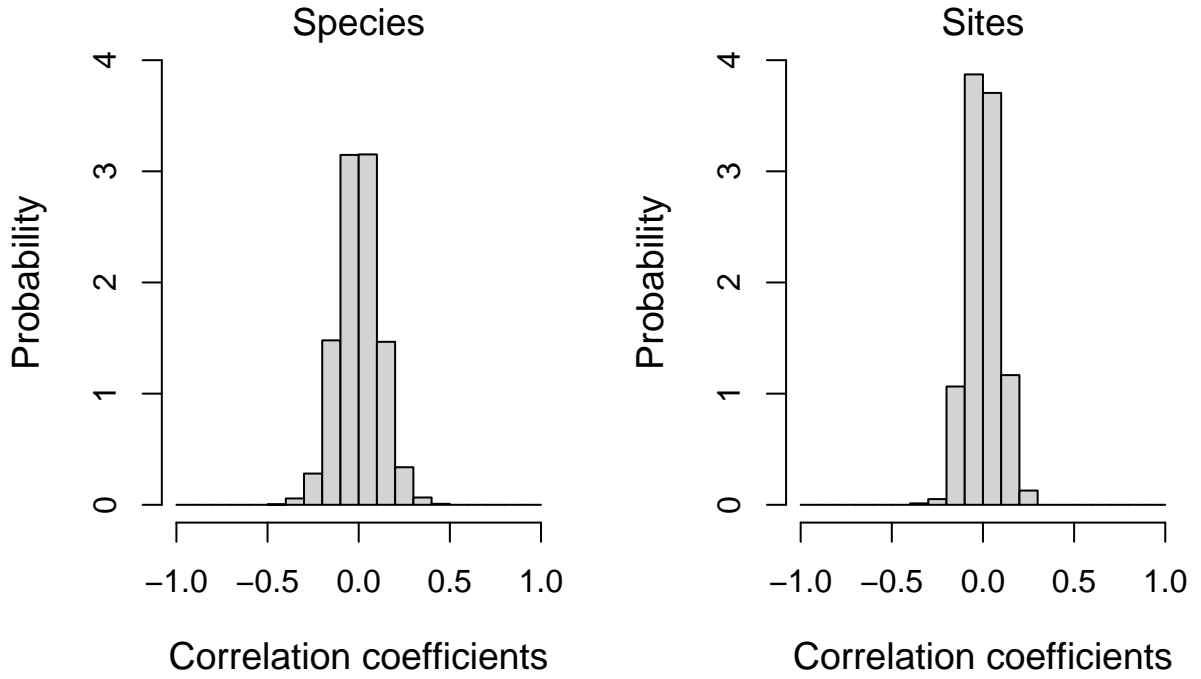

Figure S3.3: Histograms of the residual Kendall correlations for the specialists species in high-quality matrix landscapes.

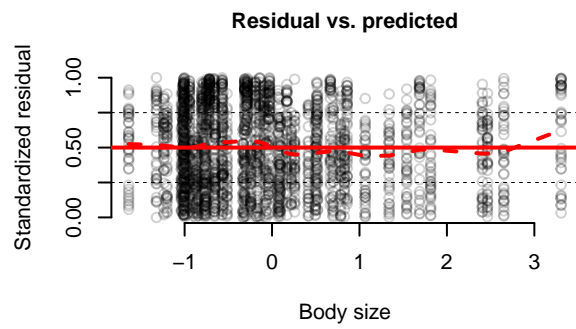

Residual diagnostic

We used DHARMA package (Hartig (2018)) for the diagnostic of quantile residuals.

DHARMA residual diagnostics

Residuals against predictors:

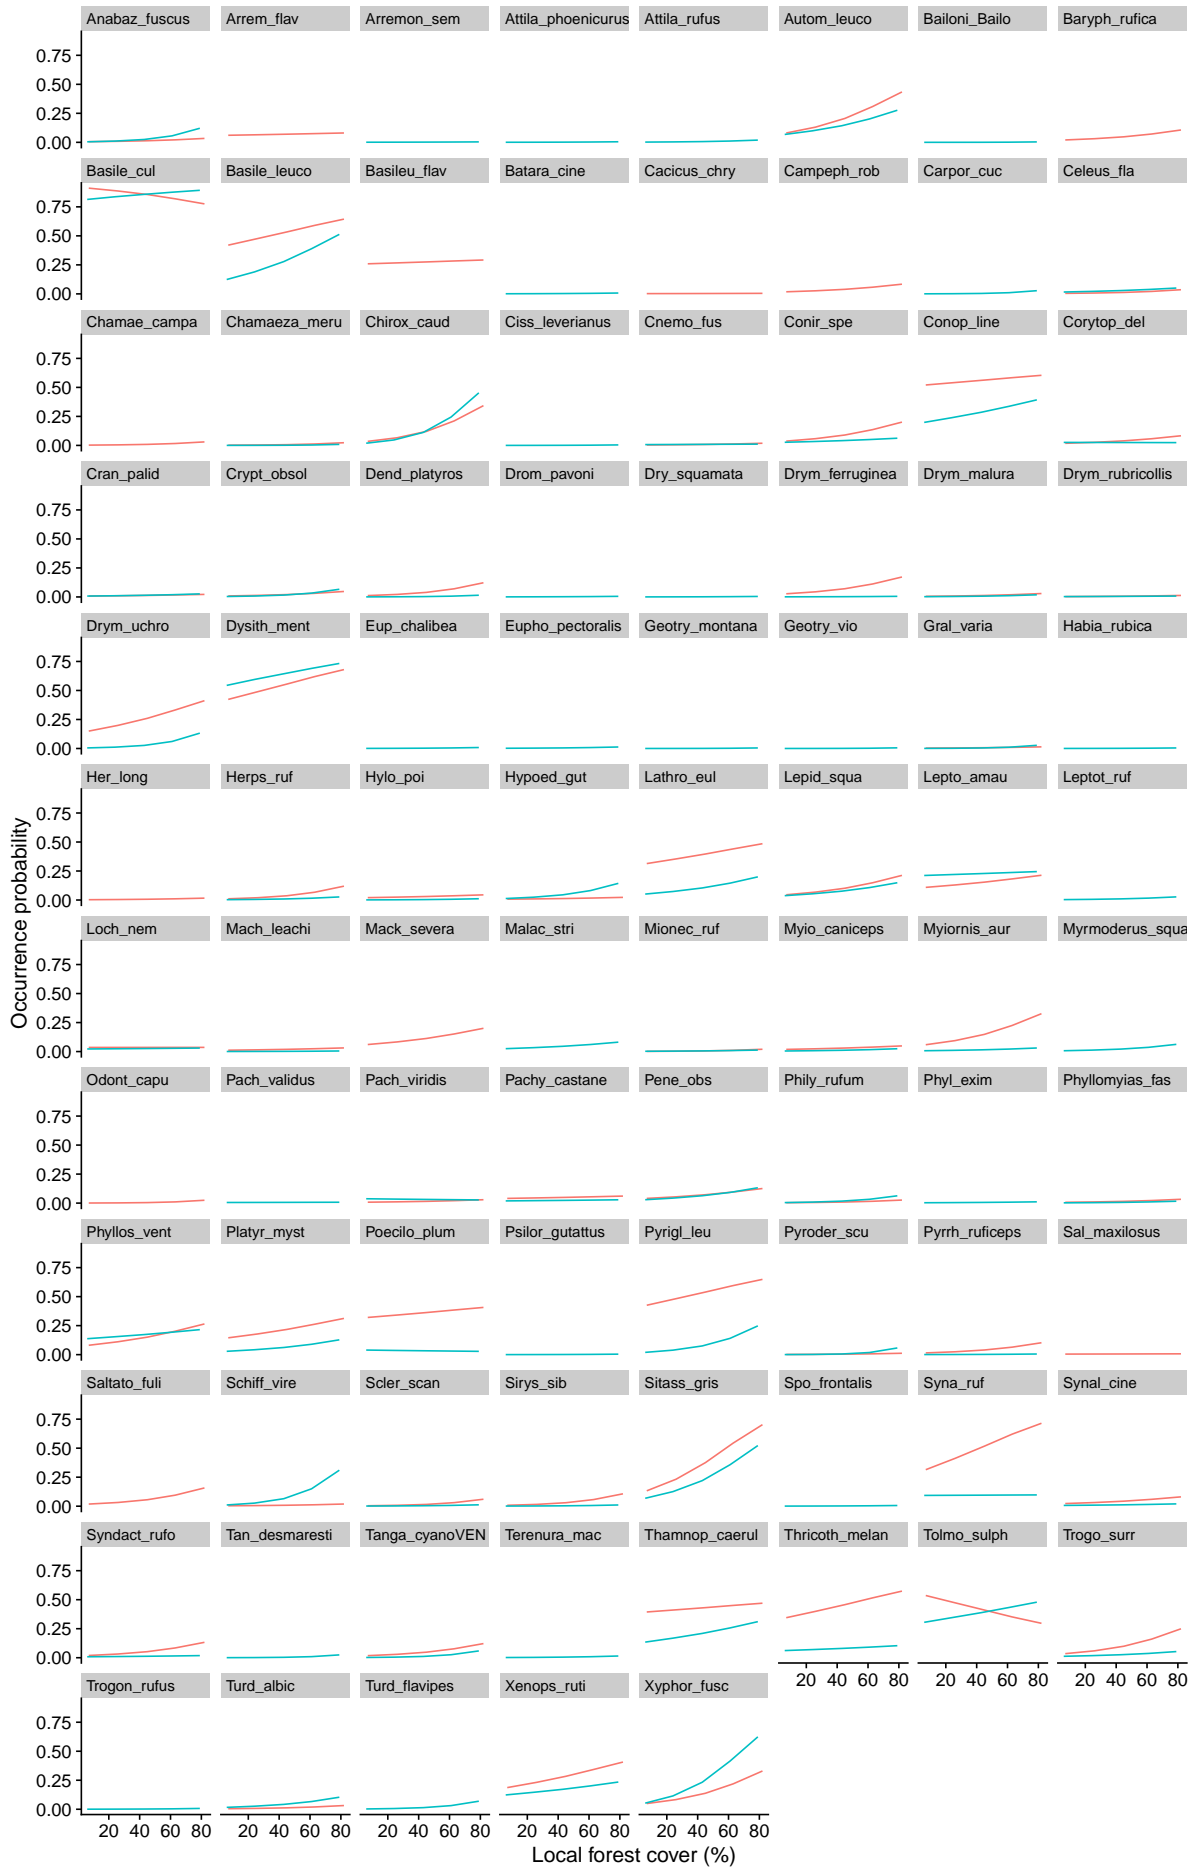

Predictions for each species local forest cover

Landscape forest cover was fixed in 30%.

Forest specialists
